-: FUNCTION: SUGGESTED TO BE INVOLVED IN KINDLING EPILEPTOGENESIS AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HIPPOCAMPAL PLASTICLTY.

-!- CATALYTIC ACTIVITY: PREFERENTIAL CLEAVAGE: ARG-, LYS-.

-!- SUBCELLULAR LOCATION: Secreted.

-!- ALTERNATIVE PRODUCTS: 2 ISOFORMS; 1 (SHOWN HERE) AND 2; ARE PRODUCED BY ALTERNATIVE SPLICING.

-!- TISSUE SPECIFICITY: ISOFORM 1 IS PREDOMINANTLY EXPRESSED IN THE PANCREAS WHILE ISOFORM 2 IS EXPRESSED IN ADULT BRAIN AND HIPPOCAMPUS. BOTH FORMS ARE ALSO FOUND IN FETAL BRAIN AND PLACENTA. NOT DETECTED IN KIDNEY, SPLEEN, LIVER AND LUNG.

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. KALLIKREIN SUBFAMILY.

-!-CATALKITIC ACTIVITY: Sedoheptulose 7-phosphate + D-glyceraldehyde 3-phosphate = D-erythrose 4-phosphate + D-fructose 6-phosphate.
-!- PATHWAY: Pentose phosphate pathway; nonoxidative part.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: BELONGS TO THE TRANSALDOLASE FAMILY. SUBFAMILY 2.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            R; Hesse, L.; Beher, D.; Masters, C.L.; Multhaup, G. FEBS Lett. 349, 109-116, 1994
A; Title: The beta-A4 amyloid precursor protein binding to copper.
A; Reference number: $46251; MUID:94320627; PMID:7913895
A; Contents: annotation; copper binding sites
A; Note: rat peptides were isolated but not sequenced
A; Note: rat peptides were isolated but not sequenced

Frederick A., Rolfe M., Chiu M.I.;
The human UNP locus at 3p21.31 encodes two tissue-selective,
cytoplasmic isoforms with deubiquitinating activity that have reduced
expression in small cell lung carcinoma cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ubl conjugation pathway; Hydrolase; Thiol protease; Multigene family; Proto-oncogene; Alternative splicing.

**C -!- FUNCTION: Functions as a receptor for membrane-bound ligand belta and Serrate to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with Su(H)

**Suppressor of hairless) and activates genes of the enhancer of Suppressor of hairless) and activates genes of the enhancer of Split locus. Essential for proper differentiation of ectoderm.

**C -:- SUBLIARITY: BELONGS TO THE NOTCH FAMILY.**

J. Blochem. 124:441-447(1982).
-! FUNCTION: Taipoxin is the most potent animal toxin known. The alpha chain possesses a phospholipase activity.
-! CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-acylglycerophosphocholine + a fatty acid anion.
-!-COFACTOR: Binds I calcium ion per subunit (By similarity).
-!-SUBUNIT: CONTAINS THREE NONCOVALENTLY BOUND CHAINS (ALPHA, BETA, AND GAMMA), EACH RELATED TO PHOSPHOLIPASE A2.
-!-SUBCELLULAR LOCATION: Secreted.
-!- MISCELLULAR LOCATION: Sereted.
-!- SIMILARITY: BELONGS TO THE PHOSPHOLIPASE A2 FAMILY.

TISSUE SPECIFICITY: PREDOMINAWILY EXPRESSED IN ENDOTHELIAL CELLS
AND THEIR PROGENITORS, THE ANGIOBLEASTS. HAS BEEN DIRECTLY FOUND
IN PLACENTA AND LUNG, WITH A LOWER LEVEL IN UMBILICAL VEIN
ENDOTHELIAL CELLS, BRAIN AND KIDNEY.

ENDOTHELIAL CELLS, BRAIN AND KIDNEY.

BALFORMATIONS (VMCM.), AN BRROW OF VASCULAR MORPHOGENESIS
CHARACTERIZED BY DILATED, SERPIGINOUS CHANNELS.
                                                    Receptor; Tyrosine-protein kinase; Transferase; Signal; ATP-binding; Repeat; EGF-like domain; Transmembrane; Immunoglobulin domain; Glycoprotein; Phosphorylation; Multigene family; Disease mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBLABILY: CONTAINS 2 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAINS. SIMILARITY: CONTAINS 3 FIBRONECTIN TYPE III-LIKE DOMAINS. SIMILARITY: CONTAINS 3 EGF-LIKE DOMAINS.

Tile-1 and tie-2 define another class of putative receptor tyrosine kinase genes expressed in early embryonic vascular system.";

Proc. Natl. Acad. Sci. U.S.A. 90:9355-9388(1993).

--- FUNCTION: THIS PROTEIN IS A PROTEIN TYROSINE-KINASE TRANSMEMBRANE RECEPTOR FOR ANGIOPOIETIN I. TY MAY CONSTITUTE THE EARLIEST MANMALIAN ENDOTHELIAL CELL INRAGE MARKER. PROBABLY REGULATES ENDOTHELIAL CELL PROLIFERATION, DIFFERENTIATION AND GUIDES THE PROPER PATTERNING OF ENDOTHELIAL CELLS DURING BLOOD VESSEL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SÜBCELLULÂR LÖCATION: TYPE I membrane protein.
